

HTML layout

HTML blocks lay out like a browser page: flex rows, grids, floats, columns and positioned boxes, then break across PDF pages.

Flex row

Grid with named areas

Float with text wrap

Text wraps around a floated box the way it does on a web page. The quote sits at the right edge, and each line beside it gets shorter so nothing overlaps. When the text passes the bottom of the float, the lines take the full width again. This paragraph is long enough to show both: the narrow lines next to the quote and the full lines below it, where the measure returns to the width of the page.

"We cut the average dock wait from 41 to 18 minutes."

Columns with a spanning heading

Columns balance their text, so all three end at nearly the	same height. A heading with column-span: all cuts the set	in two and runs across the full width.
--	---	--

Spanning heading

The text after the heading starts a second balanced set. Rules between the columns	come from column-rule, and the gap from column-gap.
